Pla-ton'ic, *n.* **1.** A follower of Plato; a Platonist.

Pla'to-nism (plā'tō-nĭz'm), *n.* **1.** The philosophy of Plato (b. 427, d. 347 B.C.), who is usually reckoned the greatest thinker of all time in what passes for the province of philosophy, this without denying Aristotle's superior merits in using the master's insights to found the sciences of Nature and Man. I. Plato had learned from Socrates how to analyze views and opinions so as to separate the permanent from the transient and variable: looking in the former (the permanent) for the causal elements which explain the changes in the world of experience. His great discovery is the principle of the **self-moved** as the origin of the transient and variable. There are two orders of being in the world: (*a*) the self-moved and (*b*) whatever is moved by another. In the Phædrus (245) he says: The soul is immortal because movement belongs to it essentially; that which derives its motion from another and a cause from other ceases to live when it ceases to move; . . . the self-moving (τὸ αὐτὸ αὐτὸ κινοῦν) is the origin and fountain of all movement in the world and it is the very essence of the soul. There is (Laws, 894) motion which is derived from other things and can be imparted again to other things but cannot move itself; and a second kind of motion which can move itself as well as other things . . . and is the source of all motion in the world; it is the eldest and mightiest principle of change, while derivative motion is secondary . . . ; the self-moved is of the same nature with that which we call soul (408). (So in the Phædon, the Republic, the Timæus, the Sophist, etc.) Corresponding to the two orders of being are the two orders of knowing, sense experience and philosophy. Philosophy knows self-movement as the ultimate explanation of the world of change. It is sure that all ultimate being is self-moved and that everything changing and variable is dependent on some self-moving center. Independent being comprehended of self-moving centers Plato names IDEAS. III. An idea (ἰδέα or εἶδος) is a self-moving being of the nature of Soul or Life, and as such must be presupposed as the independent being underlying every phenomenon, more or less removed from it, and connected by a longer or shorter causal chain (See IDEA, 9; also ENTELECHY and ARISTOTELIANISM.) IV Plato's use of the word TRUTH (ἀλήθεια) is founded on this distinction of dependent and independent being. The more nearly it approaches to self-movement, the more truth a being has. This is an implication that all beings are in some way connected with the realization of self-movement in its highest form as Reason (Νοῦς), and Aristotle's works are inspired with this thought. V. The BEAUTIFUL is the shining splendor of self-movement (Phædrus). The appearance of self-activity in matter makes it beautiful. VI. The GOOD. Plato finds the self-moved altruistic; it moves others besides itself. In the Timæus the self-moved as the Good creates the world "Having no envy, He desired that all things should be as like Himself as possible. . . . He created the world to be a

Cf. PLIGHT a pledge, REPLEVIN.] **1.** *Law.* a In early English law, a person whose body is given as security for the performance of an obligation, as a member of a frankpledge; a bail; a hostage. — the modern chattel pledge being then called a *gage*. *Now Hist.* "I am Grumio's *pledge*." *Shak.* b A chattel, or object of personal property, delivered by a debtor or obligor to a creditor or obligee to be kept by the latter until the debt or obligation is satisfied; an object given as security by pledge. c A bailment of a chattel, or object of personal property as security for the satisfaction of a debt or other obligation; also, the contract, obligation, or form of property, incidental to such a bailment; as, to give or put in *pledge*. Originally, in this sense, *pledge* was used of the delivery (without transfer of title) of movables, or objects capable of physical delivery, corresponding to the *pignus* of the Roman law, and was sharply distinguished from a common-law mortgage by the fact that in a pledge the title was not transferred, while in the mortgage it was. Later *pledge* was applied to the transfer of a chose in action by delivery and transfer of title, and by equity and statutory law the title to the mortgage came to be viewed as remaining in the mortgagor, so that now in many cases a transaction may be construed either as a mortgage or as a pledge according as one or the other appears to have been intended. Transfer of possession, however, is essential to a pledge, but not to a mortgage.

po′lar (pō′lȧr), *n.* *Math.* **a** The plane curve $x'\frac{\partial F}{\partial x} + y'\frac{\partial F}{\partial y} + z'\frac{\partial F}{\partial z} = 0$, derived from the plane curve $F(x, y, z) = 0$ (as to which it is the polar) by the operator $x'\frac{\partial}{\partial x} + y'\frac{\partial}{\partial y} + z'\frac{\partial}{\partial z}$, where x, y, z are homogeneous point coördinates and the point (x', y', z') is the pole, of which it is the polar. If the operator be applied to F repeatedly, there result in precisely the same way the 2d, 3d, . . . *n*th, polars. More generally, if $P = (a, b, \ldots \between(x, y, z)p = 0$ and $T = (A, B, \ldots \between(u, v, w)t = 0$ be respectively (homogeneous) point and tangential equations of two curves C and K, then $(a, b, \ldots \between\frac{\partial}{\partial u}, \frac{\partial}{\partial v}, \frac{\partial}{\partial w})^p T = 0$, when $p<t$, is the polar of C as to K; and $(A, B, \ldots \between\frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z})^t P = 0$, when $t<p$, is the polar of K as to C. **b** *pl.* Polar coördinates.

When the two have their planes of vibration at right angles to each other they are said to be crossed, and the light emerging from the polarizer is extinguished by the analyzer unless an optically active substance intervenes. See POLARIZATION, 2. There are many forms of the polari-

2. *Optics.* A peculiar condition of the rays of light, including those of the infra-red and ultra-violet parts of the spectrum, resulting in their exhibiting different properties in different directions. The term *polarization* was derived from the emission theory, assuming poles in the corpuscles analogous to the poles of a magnet, but this view is now not held. The undulatory theory is that ordinary light is due to vibrations transverse to the direction of the ray, but varying so rapidly as to show no particular direction of their own. When, by any means, these vibrations are given a definite direction, the light is said to be *polarized*, and the polarization is called, from the nature of its path, plane, elliptical, or circular. Plane polarization is effected by reflection, refraction, and in other ways. The angle of polarization, or polarizing angle, is the angle of reflection for complete polarization. For glass it is 54° 35′, for water 52° 45′, for diamond 68°, etc. The **plane of polarization** is the plane in which the light is reflected; it is disputed whether the vibrations take place in this or in the plane perpendicular to it. **Circular** and **elliptical polarization** are produced by reflection from metal surfaces or from glass surfaces under certain peculiar conditions, as in Fresnel's rhomb. In **rotatory polarization**, as shown by quartz crystals, sugar solutions, etc., a ray of plane-polarized light is changed into two circularly polarized rays, a right-handed and a left-handed. One of these constantly gains on the other, so that when, on emerging, they are reunited to a plane-polarized ray, the plane of polarization is found to have undergone an angular displacement depending on the nature of the medium and the length of the layer. Such media are said to be optically active, and are called dextrorotatory or levorotatory according to the direction in which they rotate the plane of polarization. See SPECIFIC ROTATORY POWER, MAGNETIC ROTATION.

S.*) 102). The later cases have excepted from its domain the development and administration of private law. Modern political science defines the power as a branch of internal administration in the exercise of which the executive should move within the lines of general principles prescribed by the constitution or the legislature, and in the exercise of which the local governmental organizations should participate as far as possible (*Burgess*). Under this limitation the police power, as affecting persons, is the power of the state to protect the public against the abuse of individual liberty, that is, to restrain the individual in the exercise of his rights when such exercise becomes a danger to the community. The tendency of judicial and popular usage is towards this narrower definition.

The Polynesians are variously held to be a branch of the Malay race, an offshoot of an early Asiatic Caucasian or Caucasoid race (cf. AINU, INDONESIAN), or a mixed race having a Melanesian as well as a Malay and Caucasoid strain. That Papuan and Melanesian elements enter into some of the Polynesian groups, doubtless accounts for the inferiority of the common type to the noble, or chieftain, type. The pure type is tall and statuesque, of brown or olive complexion, with wavy brown or black hair. The features are nearly Caucasian, though heavy in the lower classes. The Polynesians are cheerful, courageous, cleanly, gentle, and dignified, of keen artistic sense and highly poetical imagination, but are often indolent, lascivious, and formerly were nearly all cannibals. Tattooing is widespread, developed almost as an art among the Maoris and Marquesans. They are the most expert of primitive navigators. The taboo (which see) is the most famous of their social institutions. Of pure Polynesians the foremost are the Hawaiians, Maoris, Marquesans, Samoans, Tahitians, and Tongans. Cf. MELANESIAN, MICRONESIAN.

2. Specif.: *Law.* Act, fact, or condition of a person's having such control of property that he may legally enjoy it to the exclusion of all others having no better right than himself. What constitutes such possession depends upon the subject matter and the legal system involved; but, in general, all legal systems recognize as having possession him (as a thief) who has actual physical control of a thing and holds it for himself, the Roman and Civil law distinguishing these elements as the corpus of possession (detention, or naturalis possessio) and the *animus possidendi,* calling the two together simply *possession,* or civilis possessio. English law does not expressly recognize this distinction. Cf. DETENTION, 4, ANIMUS POSSIDENDI.

2. *Eng. Hist.* A member of any religious order holding property in lands, buildings, etc.; — used opprobriously.

pos-ses'sive (-ĭv), *a.* [L. *possessivus:* cf. F. *possessif.*] *Gram.* Designating, or pertaining to, the possessive case (see below), or a pronoun or construction, as with *of,* having the same force. Also, designating the relation so denoted. (See GENITIVE, *a.*, 1.)
possessive case, *Gram.,* the case denoting ownership, origin, or some analogous relation; as, *Homer's* admirers; the *pear's* flavor; the *dog's* faithfulness. The possessive is the only case in English nouns retaining an inflection (see APOSTROPHE, 3 **b**). The governed noun is often understood; as in, at the *printer's* [shop], "The first sight of *St. Peter's* [Church]" (*Lowell*). English idiom allows a double possessive expression with both *of* and the possessive inflection or a possessive pronoun (which here has its absolute form, *hers, ours,* etc.); as in, "This introduction *of Alterbury's;*" a friend *of hers;* where the construction had originally a partitive force, and is now often useful to prevent ambiguity; thus cf. a picture *of the Queen's,* and, a picture *of the Queen.* Except in certain established phrases (as, a *day's work, boat's length, pound's weight,* out of *harm's way*), the possessive inflection is now generally restricted to words denoting either persons or such things as (often by personification) are naturally thought of as possessing. Thus, a *man's* right; the *court's* decree; the *sun's* rays; but not, in careful usage, a *house's* roof; the *disaster's* cause. In compound expressions the possessive sign is usually at the end; as in the Emperor of Germany's mother; somebody else's sister; for David my servant's sake.
☞ Present custom favors the following uses of the *apostrophe* in possessives: (1) Before an added *s* for singular nouns; as in *dog's, James's,* and for plural nouns not ending in *s;* as in *men's.* (2) Without an added *s* for singular nouns ending in a sibilant, where the repeated sibilant would be disagreeable to the ear or eye, as often in long words or those containing more than one *s*-sound. Singular nouns of this class having two or more syllables thus usually omit the *s* when the last syllable is unaccented, as in *Moses', princess', conscience', Jeremias';* and retain it when the last syllable has an accent, whether principal or secondary; as in *Hortense's, Boniface's.* (3) Without an added *s* after the terminal *s* in plural nouns; as in *girls'.*
— **p. pronoun,** a pronoun derived from a personal pronoun and denoting possession and other analogous relations; as, *his* name; *her* home; *my* book. In English the possessive pronouns are the possessive forms of the personal pronouns; viz., *my, mine, our, ours, thy, thine, your, yours, his, her, its, their, theirs.*

4. Not contrary to the laws of thought; that may be conceived real; thinkable; as, it is *possible* that space is finite.
5. *Math.* Real, as distinguished from *imaginary. Obsoles.*
Syn. — POSSIBLE, PRACTICABLE, FEASIBLE. That is POSSIBLE, as here compared, which is not contrary to the nature of things, but which may, given the proper conditions, exist or occur; that is PRACTICABLE which may be accomplished by available means; FEASIBLE, with a less definite suggestion of concrete ways and means, applies to plans or designs that may be readily carried out; but *practicable* and *feasible* are often interchanged; as, aerial navigation between Europe and America may be *possible;* it is not yet *practicable;* wireless telegraphy has been shown to be not only *possible,* but *practicable;* "My cousin . . . express[ed] a purpose, if the matter could be contrived, of bringing you with her; I was willing to believe that you had . . . found it *feasible*" (*Cowper*); "[I] wrote . . . desiring he would . . . take care to make his ambition moderate and *feasible*" (*Scott*). Specif., an authority (a **power of appointment**) vested in one person (called donee, or appointor) to dispose of, or create rights in, the property of another, or (as defined by statute or judicial decision in some States of the United States, with reference to real estate) an authority to do some act in relation to (real) property, or to the creation or revocation of an estate therein or a charge thereon, which the owner granting or reserving such power might himself perform for any purpose (122 *N. Y.* 604, 612; *Civil Code N. D., S. D.*, etc.). Such a power with respect to real estate is said to owe its efficacy to the doctrine of uses. A *power of appointment* may be created by grant or reservation; and it is called a **general power** when the subject of it may be appointed to any person (called the **appointee**) or persons whatsoever, including the donee; a **special power** when it must be appointed to a particular person or persons. Any power is said to be a **power coupled with an interest** when it accompanies, or is coupled with, a jointly existing interest in the subject of the power (8 *Wheat.* 203); a **collateral**, or **naked**, power, when not connected with any interest of the donee in the subject. **6.** A person, agent, body, or thing having or exercising an ability to act; an individual invested with authority or having influence; an institution or government exercising control or possessing international influence; as, the great *powers* of Europe; hence, often, a superhuman agent; a spirit; a divinity. The units most commonly used are the *horse power* and the *watt*. The *power* of a direct electric current is the product of the voltage and current. The *true power* of an alternating current is the product of voltage, current, and power factor. The *apparent power* (volt amperes) of an alternating current is the product of voltage and current. See ENERGY COMPONENT. **b** Capacity for operating; as, the *power* of an engine governor. **c** Applied force; as, the *power* applied at one end of a lever to overcome a "resistance" at the other end. **d** A source of useful mechanical energy; as, water *power*; hand *power*, etc. Specif., a mechanical source, as opposed to human power. **e** A mechanism by which energy is applied; as, a dog *power*; the mechanical *powers*. *Obsoles.* **12.** *Optics.* **a** The degree to which a lens, mirror, or any optical instrument, magnifies; in the telescope, and usually in the microscope, the number of times it multiplies the apparent diameter of an object; sometimes, in microscopes, the number of times it multiplies the apparent surface. **b** The eyepiece of a telescope or microscope.

Syn. — Potency, puissance, might, ability, capacity, efficiency, efficacy. — POWER, STRENGTH, VIGOR, ENERGY, FORCE agree in the idea of ability to do or bear. POWER is the most general term, and denotes ability, whether latent or exerted, to act or effect; as, the *power* of example, to exercise the veto *power*. STRENGTH implies power, either active or passive, that is inherent; as, to push with all one's *strength*, the *strength* of a rope. VIGOR, usually confined in its application to living things, suggests physical or mental strength in healthy exercise; as, the *vigor* of youth, of a plant's growth; "Dryden expresses with clearness what he thinks with *vigor*" (*Johnson*). ENERGY is power expressed in terms of actual or potential work; as, radiant *energy*, *energy* of speech. FORCE adds the implication of resistance overcome; the *force* of an appeal, centripetal *force*. See FORCE, ABILITY, POWERFUL, VIGOROUS.

I fear these stubborn lines lack *power* to move. *Shak.*
My *strength* is as the *strength* of ten,

The doctrine is based on Christ's words to Peter in Matt. xvi. 19, "I will give unto thee the keys of the kingdom of heaven," with Matt. xviii. 18, John xx. 23. — **the powers that be**, those in authority, as officials or a ruling body. — **to do,** *or* **make, one's power**, to do one's best. *Obs.*

Syn. — Efficient, effective, effectual, efficacious, mighty, strong, forcible, cogent. — POWERFUL, POTENT, PUISSANT agree in the idea of ability to effect large results (see EFFECTIVE). POWERFUL applies to whatever is capable of producing, in any fashion, great effects; as, a *powerful* locomotive, athlete, monarch, medicine, spell; "mixtures *powerful* o'er the blood" (*Shak.*). POTENT suggests some inherent, it may be latent or lurking, virtue or energy, which works out its effect with certainty; as, "Magic *potent* over sun and star" (*Wordsworth*); "How *potent* is this Oriental blood in Napoleon, in Goethe, in Heine, Victor Hugo" (*Lowell*); a *potent* spell, medicine, but not a *potent* locomotive, athlete. PUISSANT, a book word, referring chiefly to persons (usually princes and potentates) or to bodies politic, connotes more the outward attributes of power; as, a *puissant* monarch, commonwealth, "most . . . mighty, most *puissant* Cæsar" (*Shak.*). See POWER.

The Presbyterian churches are trinitarian and Calvinistic in doctrine, most of them accepting the Westminster Confession of Faith and the Larger and Shorter Catechisms as authoritative. Some Unitarians in England call themselves Presbyterians, but, though descended from old English Presbyterians, they have retained nothing but the name, which is kept on account of ancient Presbyterian endowments that they continue to hold. Most of the Reformed Churches in continental European countries and the Reformed bodies (Dutch and German) in the United States are Presbyterian in polity and doctrine. The Presbyterian polity provides for the following courts: the session, the presbytery, the synod, and (usually) the General Assembly (see these terms). As used for future events sure to happen (as in, Christmas this year *is* on Friday) it is a relic of Old English, in which the present and future had the same form. See also HISTORICAL PRESENT. — **present value** *or* **worth** (of money payable at a future date), the principal which, drawing interest at a given rate, will amount to the given sum at the date on which this is to be paid; thus, interest being at 6%, the present value of $106 due one year hence is $100. Syn. — Grant, largess, benefaction, bounty. — GIFT, PRESENT, DONATION, GRATUITY, BOON. GIFT, the general term, applies to anything given; the word often (but by no means always) implies an intention to benefit or relieve; a PRESENT is ordinarily from an inferior or equal, and is always intended as a compliment or expression of good will; as, "The *gift* of God is eternal life" (*Rom.* vi. 23); "Sending portions one to another, and *gifts* to the poor" (*Esth.* ix. 22); "She used to define a *present*, 'That it was a *gift* to a friend of something he wanted, or was fond of, and which could not be easily gotten for money'" (*Swift*); "Flowers and fruits are always fit *presents*" (*Emerson*); "Little odd *presents* of game, fruits, perhaps wine" (*Lamb*). DONATION, in modern usage, suggests esp. a gift to some public institution; a GRATUITY (see GRATUITOUS) is a gift (usually of money) to an inferior, commonly for some service; as, a *donation* to a hospital, a charitable society, a *gratuity* to a porter, a waiter. BOON (properly denoting a gift asked) is now esp. applied to any benefit or advantage regarded as freely bestowed; as, "If you mean to please any people, you must give them the *boon* which they ask" (*Burke*); "I ask justice from you, and no *boon*" (*Sheridan*); "An elfin storm . . . of haggard seeming, but a *boon* indeed" (*Keats*); the priceless *boon* of sleep. 5. *Law.* An inference as to the existence of one fact not certainly known, from the known or proved existence of some other fact, founded on a previous experience or general knowledge of their connection (called a **presumption of fact**, or **logical presumption**) or founded on a rule or policy of the law requiring the reference to be made (called a **presumption of law**). A presumption of law may arise when the facts would not warrant a logical presumption; thus mere absence of a person without evidence of his having been seen or heard raises a presumption of law that the person is dead. This presumption is of the class called **rebuttable presumptions**, that may be rebutted by other evidence. The presumption that a child under seven years of age is incapable of committing a crime and the presumption that a person knows the laws are presumptions of law of the class (called **irrebuttable presumptions**) that the law does not allow to be rebutted, and are more properly classed as rules of substantive law, though many originated as presumptions of the fact.

Syn. — Appearance, assumption, show, simulation, affectation, mask, color, fabrication, subterfuge, artifice. — PRETENSE, PRETEXT, PRETENSION, FEINT, PLEA. PRETENSE applies in general to that which is falsely or deceitfully held out as real or true; a PRETEXT is more specifically an ostensible reason or motive assumed in order to conceal the true one; as, "declining to dance before her, on a *pretense* of sickness, when in fact he was in perfect health" (*Cowper*); "no odious grin of feigned benignity, insolent in its *pretense*, and loathsome in its falsehood" (*Hawthorne*); "the *pretense* that eludes the detection of others and that which deceives the pretender himself" (*Broumell*); "With his rod for a *pretext* he vainly visited each [of the farms] in turn" (*Stevenson*); "There was . . . no story, from his curious half-medical reading, he [Montaigue] would not find some plausible *pretext* to tell" (*W. Pater*). PRETENSION implies the assertion of a claim (whether true or false) to the possession of a certain character or of certain qualities; as, "[His] version . . . could make no *pretension* to verbal accuracy" (*J. Fiske*); "his *pretension* to the Epicurean conquest of a kingly indifference of mind" (*W. Pater*); "works of false sentimentality and pompous *pretension*" (*C. Brontë*). A FEINT is a deceptive act or an assumed appearance, often of the nature of an artifice or stratagem; PLEA, as here compared, suggests an (often feigned) apology or excuse; as, "Oh stay! It was a *feint* . . . I said it but to awe thee" (*Shelley*); "I make a *feint* of excusing myself" (*Lowell*); to make a *feint* of retreating; "Old Hepzibah's scowl could no longer vindicate itself entirely on the *plea* of nearsightedness" (*Hawthorne*). Theol.* The doctrine that culpability does not attach to an action based upon a judgment of its probable moral lawfulness where certainty is not attainable. In its extreme form **probabilism** is the doctrine that any view held to be probable by an approved doctor of the church is a morally lawful ground for a layman's action. Developments of probabilism are: **æqui-probabilism,** according to which if one of two opinions be followed it must be at least equal to the other in probability; **probabiliorism,** denying the possibility of equal probability, and requiring the choice of the more probable; and **tutiorism,** requiring that the opinion of greater moral safety be chosen even if less probable.

Thus, as an unweighted die thrown up may fall equally well with any of its six faces up, there are six ways of happening; the ace can turn up in only one way; the chance of the ace is $\frac{1}{6}$. **4.** *pl.* A forecast of the weather, esp. the official daily forecast of a government service.

Syn. — Likeliness, likelihood, chance; credibility.

probability curve, *or* **curve of frequency of error,** *Math.,* a curve whose ordinates represent the relative frequency of an error in a large group of observations or measurements, the size of which error is represented by the corresponding abscissa. Syn. — See LIKELY.

probable cause, *Law,* a reasonable ground of presumption that a charge is, or may be, well founded. Two definitions of probable cause with reference to the criminal prosecutions and actions in tort are in general acceptance. One is that "probable cause is the existence of such facts and circumstances as would excite the belief in a reasonable mind, acting on the facts within the knowledge of the prosecutor, that the person charged was guilty of the crime for which he was prosecuted." The other, and more widely accepted definition, tantamount to this, is: "probable cause means a reasonable ground of suspicion, supported by circumstances sufficiently strong in themselves to warrant a cautious man in the belief that the person accused is guilty of the offense with which he is charged" (*Fed. Cas.* 9926). Probable cause in civil suits is in principle the same: — **p. error.** *Math.* See ERROR, 6. — **p. life,** *Life Insurance,* the period during which one half the people of a given age at a given time will remain alive, according to the mortality table; — sometimes called *equation of life.* Cf. EXPECTATION OF LIFE.

probate court, a court for the probate of wills, etc.

pro'bate (prō'bāt), *n.* **1.** Proof; test. *Obs. Skelton.* **2.** *Law.* Official proof; esp., the proof before a competent officer or tribunal that an instrument offered is the last will and testament of a person deceased as it purports and is alleged to be; also, rarely, an officially authenticated copy of a will so proved. Also, the right or jurisdiction of hearing and determining questions or issues arising in matters concerning the probate of wills or the administration of decedents' estates. The effect of probate of a will is to establish its prima-facie validity both as to manner and form of execution and as to the testator's capacity, but not generally to establish the validity of its provisions. Jurisdiction of the probate of wills and administration of decedents' personal estate was obtained by the ecclesiastical courts early in the Middle Ages in Europe, and so continued in England until the Court of Probate was created by Act of 1857 (see PREROGATIVE COURT) and was given the jurisdiction in probate matters over both realty and personalty, which jurisdiction was later transferred by the Judicature Acts to the Probate Division of the High Court of Justice. Prior to 1857 probate was, in England (except in case of *bona notabilia* — which see), before the ordinary, and might if uncontested be made in **common form,** that is, by the executor's own oath, or in **solemn form,** that is, by witnesses. The distinction between probate in common form (which now may take place in a subordinate jurisdiction, called a **district probate registry**) and that in solemn form (which must be before the Probate Division or a county court) is maintained. In the United States the **probate courts** have from the first been civil courts, variously designated, usually according to their previous colonial character, as: **court of probate,** as in Connecticut; **surrogate's court,** as in New York; **ordinary's court,** as in Georgia and formerly in South Carolina; **orphans' court,** as in Delaware, Maryland, New Jersey, and Pennsylvania; or **prefect's court,** as in New Mexico. In some States these courts control the appointment of guardians, the adoption of children, changing of names, etc.

Cf. PROFIT A PRENDRE.

☞ The word *profit* in senses 3 and 4 (above) includes any benefit or advantage accruing from the management, use, or sale of property, or from the carrying on of any process of production, or from the conduct of business. It may be used concretely to designate either (1) the excess (called **gross profit**) of gross receipts over the expenditures directly involved in production or purchase, not deducting for interest, insurance, or even, for some purposes, general expenses of management, etc.; or (2), the net proceeds (called **net profit**) obtained by deducting from the gross proceeds all forms of expense or outlay involved in, or incidental to, the business in question, as in calculating the annual profit of a business, where insurance, wages, and other items of current expense are deducted (94 *U. S.* 500), or often, also, interest (9 *Wall.* 788, 804), and wear and tear, etc., but not any abnormal appreciation or depreciation of the capital employed.
5. The ratio of profit (in sense 4) for a given year to the amount of capital invested.
6. Commonly in *pl.* The share of the employing classes in the distribution of the products of industry, as distinct from *wages*, which constitute the share of the laboring classes, and *rent*, which constitutes the share of the landowning classes. It was regarded by English economists as covering interest, insurance for risk, and wages of superintendence. But Walker and American economists in general have held that profit as a share in distribution does not properly include either interest or insurance, but represents the reward of the employer for his skill, as distinct from that of the capitalist for his saving. This view is now the one generally prevalent. Cf. ENTREPRENEUR, EARNING, 2, *pl.*

Prometheus, it was said, sided with the Olympians in their struggle against the Titans, but, grieved at their neglect of mankind, he stole fire from heaven and bestowed upon man it and the arts which control of it makes possible. Zeus, angered at this, had him bound to Mount Caucasus. But Prometheus, who was gifted with prophetic foresight, knew the source from which Zeus was to be eventually overthrown, and the god, to win this knowledge, offered to release him. The Titan refused, rather than perpetuate an unjust reign. Zeus then caused a vulture daily to consume his liver, which grew again at night, dooming him to this fate until some immortal should consent to die in Prometheus's stead. This Chiron did, and Hercules slew the vulture and released the Titan. Cf. EPIMETHEUS.

pro'te-ose (prō'tē-ōs), *n.* [*proteid* + *-ose*.] *Physiol. Chem.* Any of a class of intermediate soluble products formed from proteids by digestion with gastric and pancreatic juice, and also by the hydrolytic action of boiling dilute acids and alkalies, etc.; an albumose. The distinction between the *proteoses* and the final proteid products, or peptones, is a difficult one. Formerly the basis of separation was the behavior of a solution toward nitric acid, acetic acid, potassium ferrocyanide, and acidified salt solution, peptones being precipitated by none of these reagents, proteoses by all. At present those products which can be salted out, esp. by ammonium sulphate, are called proteoses, while those which remain in solution under this treatment are called peptones or pure peptones. Proteoses are divided into two groups, the *primary* and *secondary* proteoses, the former including the *protoproteoses*, *heteroproteoses*, etc., the latter (more nearly allied to the peptones) the *deuteroproteoses*. The molecular weight of deuteroproteose has been estimated to be 2500–3200, as compared with 5000–7000 for albumins and 400–250 for peptones.

posed to that of the nucleus; cytoplasm. c As used by Strasburger, 1882, and nearly all recent biologists, the essential substance both of the cell body and nucleus of cells of animals and plants (see CELL, 8). It is now regarded as the only form of matter in which, or by which, the phenomena of life are manifested, and is hence often called the physical basis of life. Protoplasm exists in many different modifications; ordinarily it is a thick viscous semifluid or almost jellylike, colorless, translucent material containing a large percentage of water, and holding fine granules in suspension. Chemical examination of protoplasm after the death of the cell shows that it is composed mainly of protein substances (see PROTEIN), but during life its molecules are unquestionably of a much more complex and unstable nature, and as long as the organism lives the protoplasm is the seat of more or less active chemical changes, both destructive and constructive (see METABOLISM). Under the microscope protoplasm rarely appears homogeneous, but its physical structure is a matter of dispute, and is probably not always the same. A more fluid ground substance can generally be recognized, and this, according to one theory (the reticular theory), fills in the meshes of a network of a more solid substance; according to the alveolar theory, the ground substance forms minute drops surrounded and kept apart by a material of a different physical character, as in an emulsion.

Pro'to-zo'a (-zō'ă), *n. pl.* [NL.; *proto-* + *-zoa.*] *Zoöl.* A phylum of animals whose chief characteristics are that the body consists of only a single cell (in a few cases of several or many cells connected to form a colony), and that they reproduce, not by eggs or spermatozoa, but by the fission of the body (usually by a process of mitosis) into two or more new individuals. In some cases a union of two individuals (called *conjugation*) comparable to the process of fertilization in the higher animals is known to occur, but usually only at an interval of many generations. Most of the Protozoa are too minute to be visible to the naked eye. They are mostly aquatic, abounding in the sea and in stagnant fresh water. Some are parasites, and (as the malaria parasite) are the cause of special diseases. The group comprises a great variety of forms, some permanently attached, others which crawl by means of temporarily extruded processes (*pseudopodia*) or swim by cilia or long flagella; some which secrete a shell or case, others entirely naked. Among them are the lowest and simplest of known animals, but some exhibit a considerable number of parts and organs differentiated for particular functions. A common classification of the Protozoa is into the classes Rhizopoda, Mastigophora, Sporozoa, and Infusoria.

Told by her sisters that her lover is a monster, she brings a lamp to the bedside one night when he is asleep. A drop of burning oil falling on his shoulder awakes him, and he leaves in anger. Psyche is then condemned to long wanderings and labors, imposed by Venus, but at last is reunited to her lover, made immortal, and raised to Olympus.

See PSYCHICAL.] The science of mind ; systematic knowledge and investigation of the genesis, powers, and functions of mind ; also, a treatise on this science. Previous to the 19th century *psychology* was generally considered a branch of metaphysics In the earlier development it consisted chiefly of a doctrine of mental faculties or powers, discovered mainly by introspection, and is hence called the **faculty psychology**. "Aristotle's *De Anima* considered plant life as well as animal and human life : (1) the digestive process, (2) locomotion, (3) feeling, (4) representative imagination, (5) discursive reason, (6) pure reason." (*W. T. Harris*). The rise of the **associationism**, or associational psychology, of Hartley, Hume, and the two Mills, paved the way for the **new psychology**, of the 19th century, which has diversified into many specific branches. In respect to method, psychology is divided into two great divisions: **analytic**, or **introspective psychology**, devoted to description of mental processes as they are immediately apprehended ; and **experimental psychology**, which includes (1) **psychophysics**, sometimes restricted to the relations of physical stimuli to sensations, and sometimes extended to include (2) **psychophysiology**, or **physiological psychology**, which treats physiological and psychical processes in their mutual relation, and (3) **psycopathology**, which is the study of aberrant mental conditions, and includes **psychiatry** and **abnormal psychology**. In respect to the subject treated, psychology is divided into three subsciences : First, **individual psychology**, which treats the developed mind of the individual ; second, **comparative psychology**, which is the comparative study of different classes of minds, and includes **animal**, **folk**, **race**, and **social psychology**, the latter including **criminal psychology**, and the study of degenerates ; and third, **genetic**, or **evolutional**, **psychology**, which is the study of the mind's development, and includes child **psychology** and the genetic studies of the various departments of comparative psychology. There are many other divisions of psychology, but they are of little importance in classification.

Psychology, the science conversant about the phenomena of the mind, or conscious subject, or self. *Sir W. Hamilton.*

Psychology is the science of mental life, both of its phenomena and of their conditions. The phenomena are such things as we call feelings, desires, cognitions, reasonings, decisions, and the like ; and, superficially considered, their variety and complexity . . . leave a chaotic impression on the observer. *Wm. James.*

Psychology investigates the history of individual consciousness, and this coincides with the history of the process through which the world comes to be presented in consciousness. . . . When, on the other hand, the nature of knowledge is considered apart from its genesis, it becomes the subject matter, not of *psychology*, but of metaphysics *G. F. Stout.*

pulse, *n.* [ME. *pous*, OF. *pous*, F. *pouls*, fr. L. *pulsus* (sc. *venarum*), the beating of the pulse, the pulse, from *pellere, pulsum*, to beat, strike; cf. Gr. πάλλειν to swing, shake, πελεμίζειν to shake. Cf. COMPEL, IMPEL, PUSH.] **1.** A regular beating or throbbing caused in the arteries by the contractions of the ventricles of the heart. The arteries being already filled with blood under pressure, the additional quantity of blood forced into them by each ventricular contraction causes a distention of the arterial walls. These, contracting again through their own elasticity, force the blood along, distending in turn the part of the artery next beyond. A series of such distentions thus travels along the arteries, moving from the heart. The pulse is lost in the capillaries, and hence is not observable in the veins. In the jugular veins, however, a so-called *venous pulse*, communicated indirectly from the contraction of the right ventricle, may sometimes be noted. The human pulse is usually observed in the radial artery of the wrist. Its normal frequency (variable with age, emotions, muscular exertion, etc.) is from 70 to 75 per minute, but is much higher in infants and lower in old people. In the horse it is from 28 to 38 per minute.

Description of Illustration. A, B Water Chambers. *C* Delivery Chamber (at back). *D* Suction Valve, closed. *E* Delivery Valve, open. *F* Foot Valve, open. *G* Ball Valve. *H* Steam Pipe. *K* Delivery Pipe (at back). *L* Intermediate Water Vessel and Air Chamber, to fill *A, B* on starting. *M, N* Ports connecting *A* and *B* with *C*. *P* Suction Pipe. The action is as follows: Steam from *H* displaces water in *A* through a valve (not shown) into *C* until water level reaches *N*, when the rush of steam into *C* causes nearly instantaneous condensation; then *G* shuts off steam, *D* opens and causes *A* to fill again through *F* and *E* by suction. The steam now acts on *B*, shuts *E*, and causes the same action as on the other side.
